

MODEL 700 INDICATOR OPERATING INSTRUCTIONS

OPERATING CONTROLS DEFINED

POWER SWITCH

Enables or disables battery power to the scale; should be set to OFF when scale is not in use and when battery is being charged.

COARSE ZERO POTENTIOMETER

Recessed in bottom panel of Indicator; used to coarse-adjust displayed value as closely as possible to zero value. For first time set-up and troubleshooting procedures. Adjustment range is 17 full turns.

ZERO ADJUST KNOB

Used to fine-adjust displayed value to zero for day-to-day scale use. Adjustment range is 10 full turns. Zero range is $\pm 2.5\%$ of capacity: ± 500 lbs, or ± 227 kgs.

ALARM ADJUST KNOB

Turned to display weight level at which ALARM LIGHT will illuminate. This weight level registers on display only when ALARM SELECT SWITCH is in LOAD or UNLOAD position. Adjustment range extends from zero to half capacity in 10 full turns.

ALARM SELECT SWITCH

Switched to LOAD or UNLOAD position to enable ALARM LIGHT (1) to pulse on and off when scale weight is 50 lbs., or 23 kgs., from preselected weight value and (2) to stay

on continuously when scale weight is 8 lbs., or 4 kgs., from preselected weight value.

In both LOAD and UNLOAD modes, display counts back from display of preselected weight to zero as scale weight changes.

Switched to GROSS position to disable alarm and allow gross display of weight on scale.

ZEROING THE SCALE

1. Lift POWER SWITCH all the way up and release.
2. Verify that all Weigh Bars® are connected to Indicator and that scale is empty, then set ALARM SELECT SWITCH to GROSS.
3. Set ZERO ADJUST KNOB to center of its adjustment range, 5 full turns from either end.
4. With small screwdriver, such as tweaker shipped with product, adjust COARSE ZERO POTENTIOMETER until display reads as close as possible to zero. Turn clockwise to increase and counter-clockwise to decrease display. For most situations, you can skip this coarse zero adjustment after first time set-up.
5. Turn ZERO ADJUST KNOB until a precise reading of zero is displayed.
